

# Little To Large

A Family-Run Events Company

My project was based on a newly-formed company that members of my family have set up. The long term aim is for this to be a fully functioning website with genuine users and events. Part of the brief (i.e. user stories);

*The website needed to outline what the company does and act as a reference point for clients. There must be the ability to log in to save events.*

## Development Timeline

- Fri - Sun = Modelling & Planning
- Mon = Linking stylesheets, frameworks and installing gems.  
Getting familiar with Foundation.
- Tue-Wed = Styling, adding JS features
- Thursday = Sub-events model added, bug fixes and final styling.

## App Features;

- 4 Models - Users, Events, Sub-Events and Comments
- JQuery (sign in slider, faq's and password strength)
- Admin account with special permissions
- iCal event save

- Email notifications for event comments (essentially a chat system)
- CarrierWave & Rmagick

### Future Additions:

- Stripe Payments - Link these to the 'pay now/view invoice' button.
- Create and download invoices online.
- More readable breakdown of events, including costs.
- Live updates on event progress.
- 'Prettify' URLs.
- Event API
- On-Page event calendar

## Current Bugs

### For the next update!

- Sign in slider doesn't work on every page
- Social logos do not appear on Heroku (fine on local)
- Forms needs to be condensed.
- Date picker on new event page is clunky.
